BUILD · INTEGRATE · DEPLOY · OWN OUTCOMES

From AI user to production AI engineer.

Build reliable AI systems across the full engineering path, then take them into real enterprise environments with customer discovery, integration, adoption and measurable outcome ownership.

Hybrid guided program | Multi-stack entry paths | Applied capstone

Explore the program →

</>
Build across stacks
Python, .NET, Java or Node.js

AG
Engineer agent systems
Tools, memory, MCP and skills

CI
Operate in production
Evals, LLMOps, scale and cost

◎
Own business outcomes
Discovery, adoption and value

SHARED FOUNDATION

AI Essentials - *learned by building,* not memorising.

Engineering depth comes first. Learners build the architecture underneath reliable AI products before moving into enterprise delivery.

Multi-stack AI development

Enter through Python/FastAPI, C#/.NET, Java/Spring or Node.js/TypeScript.

RAG and enterprise knowledge

Embeddings, vector stores, retrieval, document AI and grounded answers.

Agents and tool use

Function calling, tasks, memory, MCP, skills and multi-agent coordination.

Voice and multimodal AI

STT, TTS, realtime conversations, vision and document understanding.

Production AI engineering

Docker, cloud, CI/CD, evaluations, observability, scaling and cost control.

Enterprise integration

SSO, RBAC, APIs, databases, SharePoint, CRM, SAP and legacy platforms.

The learning journey

1. AI-aware developer
2. AI app engineer
3. Agent engineer
4. Production AI
5. FDE

CORE PROGRAM

Forward Deployed AI Engineering *with AIDLC.*

Each module produces a practical artifact: requirement, architecture, prompt contract, RAG pipeline, agent workflow, evaluation report or deployment evidence.

What you build

01
FDE & AIDLC Foundations
Discovery, business framing and outcome criteria.

02
LLM Application Engineering
Model APIs, structured output, tools and robust patterns.

03
RAG & Knowledge Systems
Ingestion, chunking, embeddings, retrieval and grounding.

04
Agentic AI
Tools, planning, memory, tasks, approvals and human control.

05
MCP Skills & Multi-Agent
Reusable skills, orchestration and coordination risk.

06
Evaluation & Guardrails
Quality, safety, privacy, regression and policy controls.

07
Production AI Engineering
Security, observability, cost, latency, caching and recovery.

08
Forward Deployment Capstone
Discovery through build, rollout, adoption and outcome review.

AI DEVELOPMENT LIFE CYCLE (AIDLC)

1 Discover

2 Design

3 Build

4 Evaluate

5 Deploy

6 Adopt

OUTCOME-DRIVEN

What participants should be able to do.

- Assess real AI needs
- Design LLM, RAG and agent architectures
- Connect enterprise systems and data
- Create evaluation strategies
- Deploy with guardrails and observability
- Communicate decisions in business language

“Don’t just learn how to **use AI tools.** Learn how to **engineer AI systems** that survive real enterprise constraints.”

IDEAL PARTICIPANTS

1. Software developers
2. Tech leads
3. Architects
4. AI engineers
5. Data engineers
6. Engineering managers

FREE ENTRY WEBINAR

The Rise of the Forward Deployed AI Engineer

How engineers move from AI-assisted coding to owning production AI outcomes.

- Real enterprise use cases
- Actionable frameworks
- Q&A with practitioners
